

# Main Improvements to the Report

## Suggested with the intermediate report:

- We incorporated all the suggested phrasing modifications, taking care to explicitly state.
- We added justification to our claim that popular posts generally have higher scores.
- We created prediction models using linear/logistic regression, random forests and naïve-bayes.

## Suggested with the final presentation:

- We read the work of Daniele Romano and Martin Pinzger: Towards a Weighted Voting System for Q&A Sites. We added it to our related work section and suggested future work including their weighted vote system.

## Other improvements:

- We extended our analysis on answer quality by also measuring (and predicting) the ratio between answers' scores and those of their questions (and included this in the methodology and results sections).
